

ALTA is the first and only commercially available software package designed expressly for quantitative accelerated life testing data, using rigorous scientific analysis methods. The software is available in two versions: ALTA Standard and ALTA PRO, which provides advanced capabilities.

- Supports complete and right censored (suspended) data, entered individually and in groups, with up to eight stress types.
- Lifetime distributions include Weibull, lognormal and exponential.
- Life-stress relationships include Arrhenius, Eyring, Inverse Power Law, Temperature-Humidity, Temperature-NonThermal, Proportional Hazards, General Log-Linear and Cumulative Damage.
- Supports stress profiles that vary with time, such as step-stress, ramp-stress, etc.
- Provides a complete array of results and plots, with confidence bounds available for parameters and calculated results.
- And much more...
